automateConquestModel: Write all requirend Input for a single Con-Quest Run.

Description

Index

automateConquestModel facilitates data analysis using the software ConQuest. It automatically writes ConQuest syntax, label, anchor and data files for a single model specified by several arguments in R. Moreover, a batch file is created to start the analysis. For automatically specifying and running several models in a row, see automateModels.

Usage

automateConquestModel(dat, ID, regression=NULL, DIF=NULL, group.var=NULL,
weight=NULL, items, na=list(items=NULL, DIF=NULL, HG=NULL, group=NULL,
weight=NULL), person.grouping=NULL, item.grouping=NULL, compute.fit = TRUE,
model.statement="item", m.model="1pl", Title = NULL, jobName, jobFolder,
subFolder=list(), dataName=NULL, anchor=NULL, pathConquest, method=NULL,
std.err=NULL, distribution=NULL, n.plausible=NULL, set.constraints=NULL,
nodes=NULL, p.nodes=NULL, f.nodes=NULL, n.iterations=NULL, converge=NULL,
deviancechange=NULL, seed = NULL, name.unidim=NULL, allowAllScoresEverywhere = FALSE,
equivalence.table="wle", use.letters=FALSE, checkLink=FALSE, verbose=TRUE,
export = list(logfile = TRUE, systemfile = TRUE, history = TRUE, covariance = TRUE,
reg_coefficients = TRUE, designmatrix = TRUE))

Arguments

dat A data frame containing all variables necessary for analysis.

ID Name or column number of the identifier (ID) variable.

regression Names or column numbers of one or more context variables (e.g., sex, school).

These variables will be used for latent regression in ConQuest.

DIF Name or column number of one grouping variable for which differential item

functioning analysis is to be done.

group.var Names or column numbers of one or more grouping variables. Descriptive

statistics for WLEs and Plausible Values will be computed separately for each

group in ConQuest.

weight Name or column number of one weighting variable.

items Names or column numbers of variables with item responses.

na A named list of numerical vectors indicating values to be considered as missing.

Specific missing codes can be defined for each type of variable.

item. grouping A named data frame indicating how items should be grouped to dimensions. The

first column contains the names of all items and must be named item. The other columns contain dimension definitions and must be named with the respective dimension names. A value of 0 indicates that the respective item does not load on this dimension. A non-negative value indicates that the respective loads on this dimension with the specified weight. For examlpe, a value of 1.89 indicates

that an item loads on this dimension with the weight 1.89.

person.grouping

A named data frame indicating which persons should be grouped. The first column contains the identifier variable and must have the same name as the respective column in dat. The other columns contain grouping definitions and must be named with the respective group names. A value of 1 indicates that a person belongs to this group, a value of 0 indicates that the respective person

does not belong to this group.

compute.fit Logical: Should fit statistics computed in ConQuest analysis?

model.statement

A character string with the model statement to use in the ConQuest syntax. If model.statement == NULL, the model statement in the ConQuest syntax is set to item by default. When a DIF variable is specified, the model statement is set to item - [name of DIF variable] + item*[name of DIF variable] by default. When the data format is polytomous (instead auf dichotomous), the model statement has to be formulated explicitly, for example item + step when a rating scale model is to be applied, or item + item*step when a partial credit model is to be applied. See ConQuest manual for details.

m. model A character string specifying the IRT model used for analysis. At the time, only

"1PL" is available.

Title A character string with the analysis title for the ConQuest syntax. If Title == NULL,

informations about computer and user name and R version are used as title.

jobName A character string specifying the analysis name. All Conquest input and output

files will named jobName with their corresponding extensions.

jobFolder A character string specifying an already existing folder where all analysis files

will be written to, for example "C:/programme/analysis"

subFolder A named list of character strings specifying a maximum of two folders relative to

jobFolder for data and output files. Character strings must be named data and

out, for example subFolder=list(data="../../dataset/analysis1", out="../../output/arate output/arate output/a

If subFolder \$\data == NULL, the dataset is written to the folder specified by inh Folder. The same is true for subFolder \$\data = \data = \da

jobFolder. The same is true for subFolder\$out == NULL.

dataName A character string specifying the dataset name if it is intended to be differ-

ent from the name specified by jobName. If dataName == NULL, the dataset

is named [jobName].dat

anchor A named data frame with anchor parameters. The first column contains the

names of all anchor items and must be named item. The second column contains anchor parameters. Anchor items can be a subset of the items in the dataset and

vice versa.

pathConquest A character string with path and name of the ConQuest console, for example

"c:/programme/conquest/console_Feb2007.exe" if NULL the newest exe-

cutable in file.path(.Library,"eat/winexe/conquest") is used

method A character string indicating which method should be used for analysis. Pos-

sible options are "gauss" (default), "quadrature" and "montecarlo". See

ConQuest manual pp.225 for details on these methods.

std.err A character string specifying which type of standard error should be estimated.

Possible options are "full", "quick" (default) and "none". See ConQuest

manual pp.167 for details on standard error estimation.

distribution A character string indicating the a priori trait distribution. Possible options are

"normal" (default) and "discrete". See ConQuest manual pp.167 for details

on population distributions.

n.plausible An integer value specifying the number of plausible values to draw. The default

value is 5.

set.constraints

A character string specifying how the scale should be constrained. Possible options are "cases" (default), "items" and "none". When anchor parameter

are specified in anchor, constraints will be set to "none".

nodes An integer value specifying the number of nodes to be used in the analysis. The

default value is 15.

p. nodes An integer value specifying the number of nodes that are used in the approxi-

mation of the posterior distributions, which are used in the drawing of plausible

values and in the calculation of EAP estimates. The default value is 2000.

f. nodes An integer value specifying the number of nodes that are used in the approxima-

tion of the posterior distributions in the calculation of fit statistics. The default

value is 2000.

n.iterations An integer value specifying the maximum number of iterations for which esti-

mation will proceed without improvement in the deviance. The minimum value

permitted is 5. The default value is 20.

converge An integer value specifiying the convergence criterion for parameter estimates.

The estimation will terminate when the largest change in any parameter estimate between successive iterations of the EM algorithm is less than converge. The

default value is 0.0001.

deviancechange An integer value specifiying the convergence criterion for the deviance. The

estimation will terminate when the change in the deviance between successive iterations of the EM algorithm is less than deviancechange. The default value

is 0.0001.

Sets the seed that is used in drawing random nodes for use in Monte Carlo

estimation method. The default seed is 1.

name.unidim A character string with the name of one latent dimension. Alternatively, the

dimension name can be specified using the argument item.grouping.

allowAllScoresEverywhere

Logical: Relevant only in multidimensional models for polytomous data. If FALSE, different codes are allowed to occur in both dimensions, for example one dimension is measured with dichotomous items, i.e. 0/1, and the other dimension is measured with polytomous items, i.e. 1, 2, 3, 4. If TRUE, common codes for both dimension are used, i.e. 0, 1, 2, 3, 4 for both dimensions. In

unidimensional models this argument has no effect.

equivalence.table

A character string specifying the type of equivalence table to print. Possible

options are "wle" (default), "mle" and NULL.

use.letters A logical value indicating whether item response values should be coded als

letters. This option can be used in partial credit models comprising items with more than 10 categories to avoid response columns with width 2 in ConQuest.

checkLink A logical value indicating whether the items in dataset are checked for being

connected with each other via design. If TRUE, the function checkLink is called.

verbose A logical value indicating whether messages are printed on the R console.

export A named or unnamed list or vector of logical elements indicating whether Con-

quest should create logfile, systemfile, history file, covariance file, file of regres-

sion coefficients and file of designmatrix.

Details

If the folders specified in subFolder should be parent folders to jobFolder, they can be specified using double dots ... For example, if jobFolder is "C:/programme/analysis" and subFolder is list(data="../dataset/analysis1", out="../../output/analysis1"), dataset is written to "C:/programme/dataset/analysis1" and output is written to "C:/output/analysis1".

Value

No results are returned to console. Input files and batch string are written to disk in specified folder(s).

Examples

Not run:

```
# if software="conquest" (currently the only and default option) the path of the
# windows executable ConQuest console must be specified by setting
# conquestParameters = list ("pathConquest"="<path_to_your_conquest.exe>")
# e.g. conquestParameters = list ("pathConquest"=""C:/ConQuest/console.exe"")
# if not explicitely specified it is searched for in
# file.path(.Library,"eat/winexe/conquest")
# e.g. "C:/R/R-2.14.2/library/eat/winexe/conquest"
# you can put your ConQuest executable there
# load example data
# (these are simulated achievement test data)
# Note: all examples corresponding to examples in help file of automateModels
data ( science1 )
#
### Example 1: create input files for a unidimensional Rasch model with all variables in dataset science1
# only variables of science1 you want to use for analysis must be classified. In unidimensional Rasch mode
# id and items have to be specified
# automateConquestModel needs data with collapsed missing
science1.collapsed <- collapseMissings(science1, items = science1.items)</pre>
dir.create("C:/temp")
ex1 <- automateConquestModel ( dat = science1.collapsed, ID = "id", items = science1.items,
jobFolder = "C:/temp", jobName = "rasch_unidim")
### Example 2: create input files for a multidimensional Rasch model with DIF
# option item.grouping specifies dimensions and mapping of items to dimensions
# item.grouping is a data.frame with item names in first column (item)
\mbox{\tt\#} and dimensions in further columns, mapping of items to dimension is
# indicated by 0 (item loads not on dimension) or 1 (item loads on dimension)
# (have a look at the example item.grouping science1.scales)
# since 6 dimensions are specified in science1.scales input for a 6-dimensional Rasch model is run
# running this example may take some time + convergence is suboptimal. This is only for illustration.
# Note: in higher dimensional modes, number of nodes increased to 2^[number of dimensions]. If not explici
# specified by the user, automateModels automatically uses the estimator montecarlo, if nodes increased 35
# Note: As DIF variable(s) have to be numeric in Conquest, factor variables (e.g. "sex" with male/female)
# will be expressed as numeric indicator variables.
science1.collapsed <- collapseMissings(science1, items = science1.items)</pre>
dir.create("C:/temp")
ex2 <- automateConquestModel ( item.grouping = science1.scales, dat = science1.collapsed, ID = "id", items
 DIF = "sex", jobFolder = "C:/temp", jobName = "rasch_multidim" )
### Example 3: create input files for a multidimensional multigroup Rasch model with latent regression
# Note: As regression and group variables have to be numeric, factor variables (e.g. "sex" with male/femal
# will be expressed as numeric indicator variables.
# Moreover, unless estimation method is not specified explicitly, automateConquestModel chooses montecarlo
# estimation as gaussian quadrature is not available due to latent regression model and Bock-Aitken would
# 11390625 nodes. Note: As montecarlo needs to fix all item parameter when latent regression is applied, t
# parameters estimated in example 2 are used as anchor parameters here.
# Warning: This example may take a considerable amount of time. Its only for instruction.
science1.collapsed <- collapseMissings(science1, items = science1.items)</pre>
# in Conquest, latent regressors have to be numeric
dir.create("C:/temp")
# Run example 2 to gain item parameters
```

q3.p.est = c ( "wle" , "pv" , "eap" ), icc = FALSE, missing.rule = NULL,
cross = NULL, subfolder.order = NULL, subfolder.mode = NULL,
allNAdelete = TRUE, additionalSubFolder = NULL, run = TRUE, run.mode = NULL,
n.batches = NULL, run.timeout = 1440, run.status.refresh = 0.2,
cores = NULL, email = NULL, smtpServer = NULL, write.txt.dataset = FALSE,
write.xls.results = TRUE, delete.folder.countdown = 5,
conquestParameters = NULL )
```

Arguments

data.frame containing all variables type of variables ("id", "context.vars" or

"items") must be set using options id, context.vars, items

id name or column number of 'id' variable in dat

context.vars names or column numbers of 'context' variables (e.g. sex, school, ...) in dat

items names or column numbers of 'item' variables in dat if omitted, all variables that

are not classified as 'id' or 'context' variables are treated as 'items'

item.grouping data.frame with grouping information of items, first column must be 'item'

which includes item names, further columns contain scale definitions, 0 indicates that the respective item is NOT part of the scale, 1 indicates that this item

is part of the scale, colnames of columns are the names of the scales

select.item.group

character vector of scale names chosen for analysis

person.grouping.vars

character vector of 'context' variables in dataset which are used to automatically generate 'person.grouping', each category is transformed into the 'person.grouping' format

person.grouping.vars.include.all

logical vector (along person.grouping.vars), indicates whether to generate a variable 'all' for the specific variable

person.grouping

data.frame with grouping information of persons, first column must be the name of 'id' (e.g. idstud), further columns contain group definitions, 0 indicates that the respective person is NOT part of the group, 1 indicates that this person is part of the group, colnames of columns are the names of the groups

select.person.group

character vector of group names chosen for analysis

checkLink logical: If TRUE, items in dataset are checked for being connected with each other

via design (function checkLink is called) 23.02.2012: not yet implemented

additional.item.props

data.frame of additional item information to be merged to model results, first column must be 'item' and contain item names

folder folder to write output into

overwrite.folder

logical, if TRUE (default), folder is completely emptied

analyse.name.prefix

prefix (e.g. "pilotStudy") to be attached to all analyses names

analyse.name analyses names are usually automatically set, if you want to set them manually

use this option

analyse.name.elements

analyses names are set automatically using these elements: c ("scale", "group", "dif", "regression", "anchor"), use this option to change composition and

order of the analyses names generation

data.name optional: character string specifying name of dataset if intend to differ from

name specified by jobName. When dataName == NULL, dataset is named [job-

Name].dat

m.model measurement model, "1pl" (default), "2pl", "3pl", "4pl"

software "conquest" (default) no other software implemented yet dif variable that is used for differential item functioning

weight case weight variable

anchor data.frame with anchor information

regression variable(s) that is/are used

adjust.for.regression

center plausible values and items on grand mean

q3 Logical: If TRUE, Yen's Q3 statistic is computed.

q3.p.est person estimates that are used in q3 calculation, default: wle

icc Logical: If TRUE, pdfs of item icc are generated.

missing.rule definition how to recode distinct missings in dataset

cross scales in 'item.grouping' and groups in 'person.grouping' can be crossed to define distinct analyses "all": scales and groups are crossed "item.groups", scales

are separately (unidimensional) run (instead of one multidimensional model) "person.groups", person groups are separately (single group) run (instead of one

multigroup model)

subfolder.order

subfolders are automatically generated in this order c ("i.model" , "p.model" ,

"m.model", "software", "dif", "regression", "anchor")

subfolder.mode "none": no subfolders are created "full": complete subfolders are created ac-

cording to 'subfolder.order' "intelligent" (default): meaningful subfolders are

created

allNAdelete if TRUE all cases with complete missings on items are removed, if FALSE these

cases are not deleted Note: this is a global option, that is set for all modelss

additionalSubFolder

specification for 'data' and 'out' subfolder (constant over all analyses)

run logical, if TRUE (default) models are run, if FALSE only syntax is created and

batches are returned

run.mode "serial": serial runs on local machine. see option 'cores' to specify number of

parallel runs "parallel": batch files must be started manually (e.g. on several

machines). see option 'n.batches' to specify number batch files

n.batches if run.mode="parallel", number of batch files that are created, batch files contain

one or more analyses

run.timeout minutes to wait for analyses to finish, default: 1440 (24h)

run.status.refresh

time for console refresh of model run status, default: 0.2 (12sec)

cores if run.mode="serial" and multiple analyses are run, number of cores to use. if

cores=NULL (default) all cores are used if number of cores specified is greater

than number of actual cores, number of actual cores is used

email set email address to receive an email when analyses are finished or time's up

smtpServer smtpServer for sending emails, default: "mailhost.cms.hu-berlin.de"

write.txt.dataset

write out datasets as ascii, default: FALSE

write.xls.results

if TRUE (default) results are written to Excel files

Details

To run several models list parameters as corresponding lists Explicitly list NULL if parameter should not be set or be defaulted See examples

Value

```
run=TRUE returns results in specific format
run=FALSE path(es) to batch file(s) are returned as character vector
```

12 bi.linking

Description

Links results from several analysis. Each analysis is linked with each other.

Usage

```
bi.linking ( results , folder=NULL , file.name=NULL , method = NULL , lower.triangle = TRUE , so
```

Arguments

results result list from automateModels run folder output folder, will be emptied!

file.name for output excel, default: "bi.linking.results.xlsx"

method set linking method to either "Mean-Mean", "Haebara" or "Stocking-Lord" (de-

fault)

lower.triangle set reference groups for the linking

scales Character vector of scales for which linking should separately done. If NULL,

all analysis in the results list are linked. Note: due to suboptimalities in development process, analysis name must contain 'scale'! use this option with care!!

Value

writes linking results to excel file. returns linking results as list.

Author(s)

Martin Hecht

```

# each pair of these 3 analyses are linked together by bi.linking
# if not run together, you can easily combine analyses from seperate \link{automateModels} runs by calling
# in this case make sure that analysis names are unique
# start linking, results are written to folder and are returned
ex5_linked <- bi.linking ( ex5 , folder = "C:/temp/automateModels/Example5/Linking" , file.name = "ex5_linking" ,
# if you want to link analyses for which no \code{automateModels} results structure is available
# you can use \link{make.link.dummy} to create a structure similar to \code{automateModels} results structure
# this can be used as input for \code{bi.linking}
```

checkLink 13

```
# e.g. lets add an additional analysis for which only item difficulty and standard errors are available
# this information must be in a data.frame, see \link{make.link.dummy} for details
dfr <- data.frame (</pre>
"item" = c ( "BioKno01" , "CheKno02" , "PhyKno03" ) ,
"b" = c (-3.14)
                       , -2.24
                                     , -3.42
"b.se" = c ( 0.612
                                      , 0.783
                        , 0.453
# create a results object
add <- make.link.dummy ( dfr , "additional" )</pre>
# add this object to Example 5
ex5add <- c (add, ex5)
# start the linking procedure with the additional analysis
ex5add_linked <- bi.linking ( ex5add , folder = "C:/temp/automateModels/Example5/Linking2" , file.name = "c
## End(Not run)
```

checkLink

checkLink

Description

Checks whether items in a dataset are linked via design. This may be useful in multiple matrix sampling designs.

Usage

```
checkLink ( dat, remove.non.responser = FALSE, na = NA, verbose = TRUE)
```

Arguments

dat A data.frame where all columns denote test items
remove.non.responser
logical: Should cases with missings on all items be deleted?

na character string specifying values to be treat as missing by design
verbose logical: Should output printed to console?

Value

A logical value, i.e. TRUE or FALSE, indicating whether items in dataset are linked to each other.

Author(s)

Sebastian Weirich

14 compareModels

Examples

compareModels

compare ConQuest models

Description

retrieves model information (sample size, deviance, number of parameters) and calculates AIC and BIC; if more than 1 model is specified models are compared (AIC difference, BIC difference, Chi square prob.)

Usage

```
compareModels ( path , xlsx = NULL )
```

Arguments

path

either 1 of 4 inputs: [1] full path (directory + file name) of a ConQuest shw file [2] a list of ConQuest shw files (full paths) [3] a character vector of ConQuest shw files (full paths) [4] a folder in which it will be searched for ConQuest shw files

files

xlsx

full path (directory + file name) to Excel to be written (don't forget ".xlsx" suffix)

Value

returns a list of 2 data.frames: the first called 'models' contains model information; the second called 'model.comparison' contains information of model comparison

Author(s)

Examples

```
## Not run:
# just run any example of \link{automateModels}
# then:
       compareModels ( <folder> )
# e.g. compareModels ( "C:/temp/automateModels/Example3" )
## End(Not run)
```

```
ConQuest.Log.Example1.log.bz2
```

Example Log File from ConQuest

Description

This is a text file with the log from a ConQuest analysis It can be accessed via bzfile (file.path(.Library, "eat/extdata/ConQuest.Log.Example1.log.bz2"))

Format

txt

detect.suppression

detect suppression effects in regression models

Description

This function detects suppression effects in regression models.

Usage

```
detect.suppression ( dat , dependent , independent , full.return = FALSE , xlsx.path = NULL )
```

Arguments

independent

data.frame with data to be used dat dependent dependent variable in regression model

character vector of independent variables in regression model full.return if FALSE a data.frame as a quadratic matrix with suppression effects (TRUE/FALSE)

of independent variables is returned

if TRUE a data.frame with all calculated terms ist returned

xlsx.path full path of Excel file that results should be written to 16 detect.suppression

Details

formulae (13.39a) and (13.39b) decribed in Bortz (1999) page 446 are used

if full.return=TRUE a data.frame is returned.

Columns are:

rownames: <dependent variable> ~ <independent variables> | <independent variable that is tested for suppression>

multiple.reg: logical, indicates wether there are 2 (FALSE) or more than 2 (TRUE) independent variables in the regression model

dep: dependent variabel in regression model

pred: independent variable that is investigated on suppression effect

preds: independent variables in regression model besides pred

cor_pred_c: correlation of pred and dependent variable

cor_pred_fitted_c: correlation of predicted pred by indepenent variables and dependent variable

r.sq_pred: R squared from model predicting pred by independent variables

rterm.minus: right term in formula (13.39a)

rterm.plus: right termn in formula (13.39b)

rterm.minus.diff: difference of rterm.minus and cor_pred_c

rterm.plus.diff: difference of cor_pred_c and rterm.plus

(positive difference of rterm.minus.diff or rterm.plus.diff indicates suppression effect)

rterm.minus.log: logical value of formula (13.39a) rterm.plus.log: logical value of formula (13.39b)

suppression: logical, rterm.minus.log|rterm.plus.log

if full.return=FALSE a data.frame as quadratic matrix is returned:

rows and columns are independent variables

 $diagonal\ includes\ suppression\ for\ suppression\ effect\ of\ variable\ in\ multiple\ regression$

triangles include suppression for bivariate independent variables, "row" suppresses "column"

Value

depends on options full.return

dichotomize 17

dichotomize

dichotomize a numeric vector

Description

dichotomize a numeric vector by median or mean split

Usage

```
dichotomize ( numvec , method = c("median", "mean") , randomize = TRUE , ... )
```

Arguments

numvec numeric vector

method either median or mean split

randomize logical, if TRUE elements that equal the split threshold are randomly assigned to

one of the two groups if FALSE default behavior of cut is used

... arguments are passed to set.seed and cut

Value

returns vector with dichotomization indicators

Author(s)

Martin Hecht

Examples

```
numvec <- c(1,2,3,4,5)
dichotomize ( numvec )

# set seed for random assignment of elements that match split threshold by passing argument seed to function
# ( 3 in numvec is on threshold if median is used )
dichotomize ( numvec , seed = 12345 )

# set level names by passing argument labels to cut function
dichotomize ( numvec , labels = c ( "low" , "high") )</pre>
```

equating.rasch

Align Item Parameters from Separate Analyses

Description

This function can be used to align two sets of item parameters from two different Rasch analyses (e.g., two populations of examinees of differing abilities) so that they are on the same scale. The item parameters of one group are transformed to the scale of the other group by adding a constant.

18 equating.rasch

Usage

equating.rasch(x, y, theta = seq(-4, 4, len=100), method = c("Mean-Mean", "Haebara", "Stocking-method = <math>c("Mean-Mean", "Haebara", "Stocking-method = c("Mean-Mean", "Haebara", "Stocking-method = <math>c("Mean-Mean", "Haebara", "Stocking-method = c("Mean-Mean", "Haebara", "Hae

Arguments

Х

У

A data frame with item names and parameters for group 1. This is the group which will be linked to the scale of group 2. The data frame has to follow the structure: First column contains item names for the focal group, second column contains item parameters, and, if compute.dif = TRUE, third column contains the standard errors of the item parameters.

A data frame with item names and parameters for group 2. This is the group for which the scale is defined. The data frame has to follow the structure: First column contains item names for the focal group, second column contains item parameters, and, if compute dif = TRUE, third column contains the standard

errors of the item parameters.

theta theta values where the test characteristic curves are evaluated

method Method for determining the linking constant, either Mean-Mean, Haebara or

codeStocking-Lord

compute.dif Logical: Whether differential item functioning in the two groups should be ex-

amined.

Details

equating.rasch provides three methods to determine this constant: Mean-Mean the difference of the item parameter means of both samples are obtained. Haebara additionally takes the difference between item characteristic curves into account. Stocking-Lord additionally takes the test characteristic functions in account, thus minimizing differences in expected scores rather than observed scores or parameters. In most practical applications, the three linking constants should be fairly similar.

When compute.dif = TRUE, differential item functioning (DIF) in anchor items is examined. This can be useful to examine items with large shifts, which can be subsequently excluded from the linking procedure. DIF is computed according to the formula in Lord (1980). Additionally, the magnitude of DIF is categorized as small, moderate or large according to criteria established by the Educational Testing Service (ETS): category A (small DIF) if |DIF| < 0.43 or not significantly > 0, category B (moderate DIF) if |DIF| < 0.64 and |DIF| significantly > 0, and category C (large DIF) if |DIF| > 0.64 and significantly > 0.43.

Value

A list with the following components:

B. est Linking constants determined by all three methods

descriptives A list with the number of items used for linking, linking variance and standard

deviation, and the linking error

anchor A data.frame with all item parameters used for linking from both samples and

the transformed parameters for group 1. If compute.dif = TRUE, additional

statistics for DIF are also included.

transf.par A data.frame with all item parameters from both samples and the transformed

parameters for group 1.

Description

R object created by running Example 5 of automateModels

Usage

data(ex5)

Format

complex list structure

exploreDesign

explore data design

Description

explore data structure with respect to specific missing code (e.g. "missing by design")

Usage

```
{\tt exploreDesign~(~dat~,~na=NA~,~id=NULL~,~itemsPerPerson=TRUE~,~personsPerItem=TRUE~)}
```

Arguments

dat data.frame

na missing specification id variable in dat if exists

itemsPerPerson logical, if TRUE items per person list is returned personsPerItem logical, if TRUE persons per item list is returned

20 get.dsc

Value

depends on itemsPerPerson and personsPerItem , if both are TRUE a list with both elements is returned

Author(s)

Martin Hecht

Examples

```
data(science1)
d <- science1[,!colnames(science1) %in% science1.context.vars]
design <- exploreDesign ( dat = d , na = "mbd" , id = "id" )
str(design)</pre>
```

get.dsc

Read ConQuest 'descriptives' Output Files.

Description

Reads ConQuest files with descriptive statistics for the estimated latent variables generated by the 'descriptives' statement.

Usage

```
get.dsc(file)
```

Arguments

file

Character string with the name of the ConQuest descriptives file.

Value

A named list of n elements with n being the number of groups for which descriptive statistics were computed. The names of the list are the group names. Each list contains the following elements:

single.values

A data frame containing the group name, dimension names, the number of observations, mean, standard deviation and variance for each of the latent dimensions. If the file contains descriptive statistics for plausible values, the number of rows in the data frame corresponds to the number of plausible values.

aggregates

A data frame containing the group name, dimension names and aggregated statistics for the mean, standard deviation and variance for each of the latent dimensions as well as (in a separate row) their standard errors.

get.equ 21

get.equ	Reads equivalence table created in Conquest analysis.	

Description

Reads Conquest files comprising equivalence tables for MLE or WLE parameters.

Usage

```
get.equ(file)
```

Arguments

file

Character string of the Conquest equ-file.

Value

A list of n+1 elements, with n the number of dimensions in the analysis. Each element is a data.frame, whose name correponds to the name of the dimension the values belongs to. All data.frames except the last one give the transformation of each possible raw score to the WLE or MLE score including it's standard error. First column in each data.frame contains the raw score, second column the transformed WLE or MLE score, third columns it's standard error.

The last element of the list give some sparse information about the model specifications.

References

See Conquest manual, pp.162.

get.history

Reads Conquest history files.

Description

Reads Conquest history file comprising parameter estimates of each iteration.

Usage

```
get.history(file, shw.object)
```

Arguments

file Character string of the Conquest history file.

shw.object Optional: R-Object created by get.shw(). Necessary to label the columns of

the history file.

Value

A data frame according to the corresponding Conquest history file. First column comprises the iteration number, second column the deviance of the corresponding iteration. Estimates of model parameters are listed in further columns.

22 get.itn

Author(s)

Sebastian Weirich

get.item.par

get item parameters

Description

obtain item parameters from automateModels results

Usage

```
get.item.par ( results )
```

Arguments

results

return object from automateModels

Value

returns a data.frame with item parameters from automateModels run:

Author(s)

Martin Hecht

Examples

```
## Not run:
# example results structure from \code{automateModels}
data ( ex5 )
#
( item.par <- get.item.par ( ex5 ) )
## End(Not run)</pre>
```

get.itn

Read ConQuest 'itanal' Output Files

Description

Reads ConQuest files comprising item analyses generated by the 'itanal' statement.

Usage

```
get.itn(file)
```

Arguments

file

Character string with the name of the ConQuest item analysis file.

get.latent.corr 23

Value

A data frame with one row per item response category containing the following columns:

item.nr	Number of the item in the analysis
item.name	Name of the item
Label	Response category label
Score	Score of this response category
n.valid	Total number of students who responded to this item
Abs.Freq	Number of students who gave this response
Rel.Freq	Number of students who gave this response as a percentage of the total number of respondents to the item
р	Percentage of students who answered this item correctly
pt.bis	Point-biserial for this response
t.value	T-Value of the significance test whether the point-biserial correlation is different from $\boldsymbol{0}$
p.value	p-Value of the significance test whether the point-biserial correlation is different from $\boldsymbol{0}$
PV1.Avg.1	Mean ability of students who gave this response (based on plausible values)
PV1.SD.1	Standard deviation of ability of students who gave this response (based on plausible values)
pbc	Item discrimination
threshold	Item threshold
delta	Item delta

If the model is multidimensional, the mean and standard deviation of the ability of students who gave the respective response will be shown for each dimension.

Author(s)

Sebastian Weirich

References

See pp.193 of Wu, M.L., Adams, R.J., Wilson, M.R., & Haldane, S.A. (2007). *ACER ConQuest Version 2.0. Generalised Item Response Modeling Software*. Camberwell, Victoria: ACER Press.

get.latent.corr	get latent correlations, covariance and variances	

Description

retrieve latent correlations, covariance and variances from ConQuest shw files

Usage

```
{\tt get.latent.corr}~(~{\tt path}~,~{\tt xlsx}~=~{\tt NULL}~,~{\tt covariance}~=~{\tt TRUE}~,~{\tt variance}~=~{\tt TRUE}~,~{\tt sort}~=~{\tt TRUE}~)
```

24 get.person.par

Arguments

path either 1 of 4 inputs: [1] full path (directory + file name) of a ConQuest shw file

[2] a list of ConQuest shw files (full paths) [3] a character vector of ConQuest shw files (full paths) [4] a folder in which it will be searched for ConQuest shw

files

xlsx full path (directory + file name) to Excel to be written (don't forget ".xlsx" suffix)

covariance logical: should covariance(s) be extracted (default: TRUE) variance logical: should variance(s) be extracted (default: TRUE)

sort logical: if TRUE (default) the latent correlation matrix ist sorted as in the anal-

ysis with most dimensions; if FALSE the latent correlation matrix ist not sorted, instead the order is determined by the order of dimensions in the analyses (first

to last)

Value

returns a data.frame with correlations, covariance and variances of ConQuest analysis/analyses

Author(s)

Martin Hecht

Examples

```
## Not run:
# just run any example of \link{automateModels}
# then:
# get.latent.corr ( <folder> )
# e.g. get.latent.corr ( "C:/temp/automateModels/Example1" )
## End(Not run)
```

get.person.par

get person parameters

Description

obtain person parameters from automateModels results

Usage

```
get.person.par ( results )
```

Arguments

results return object from automateModels

Value

returns a data.frame with person parameters from automateModels run:

get.plausible 25

Author(s)

Martin Hecht

Examples

```
## Not run:
# example results structure from \code{automateModels}
data ( ex5 )
#
( person.par <- get.person.par ( ex5 ) )
## End(Not run)</pre>
```

get.plausible

Read ConQuest Plausible Values Output Files

Description

This function reads ConQuest plausible value files and automatically identifies the number of cases, the number of plausible values and the number of dimensions.

Usage

```
get.plausible(file, verbose = FALSE)
```

Arguments

file Character string with the name of the ConQuest plausible values file.

verbose Logical: Should messages printed on console?

Value

A data frame with one row per person containing the following columns:

case	Case number
ID	Identifier for this case
pν	Plausible value. Columns are named pv.[name of dimension]_[number of plausible value]. For example, pv.reading_6 refers to the 6th plausible value of reading dimension.
eap	Expecteda posteriori ability estimate for this person. Columns are named eap. [name of dimension

Standard error of the EAP estimate. Columns are named eap.se.[name of dimension]

Author(s)

eap.se

Sebastian Weirich

See pp.230 of Wu, M.L., Adams, R.J., Wilson, M.R., & Haldane, S.A. (2007). *ACER ConQuest Version 2.0. Generalised Item Response Modeling Software*. Camberwell, Victoria: ACER Press.

26 get.shw

get.q3 get.q3

Description

get Q3 statistics

Usage

```
get.q3 ( results )
```

Arguments

results

results (structured list) from automateModels run

Value

list (analyses) of data.frames in matrix format containing Q3 statistics

Author(s)

Martin Hecht

get.shw

Read ConQuest showfiles

Description

Function reads Conquest showfiles and transforms them into a R list of data frames.

Usage

Arguments

file	Character string of the Conquest showfile to be read in.
dif.term	Optional: Character string. Name of the term considered to be DIF-term. Must match corresponding term in showfile.
split.dif	Logical: When TRUE, DIF-Parameter are only given for Reference group.
abs.dif.bound	When DIF-Parameter are evaluated, this specifies the critical value for absolute DIF.
sig.dif.bound	When DIF-Parameter are evaluated, this specifies the critical value for confidence interval DIF.

get.shw 27

Details

Funktion searches for 'TERM'-statements in Conquest showfile and reads the tables associated with. If one statement is specified to contain DIF analyses, absolute DIF value is computed 2*[group-specific parameter]. Confidence intervalls for 90, 95 and 99 percent are computed via the standard error of specific parameters. If both criteria - absolute DIF exceeds abs.dif.bound and the confidence intervall does not include sig.dif.bound, item is considered to have DIF.

Value

A list of data frames, named by the 'TERM'-statements in Conquest showfile, plus an additional data frame named regression with regression coefficients when latent linear regression model was specified in Conquest analysis, plus an additional data frame named cov.structure with covariance and correlation matrix of latent dimensions. If uni-dimensional model is specified, the variance of the latent dimension is given instead. If one term was specified as DIF-statement, the corresponding data frame is augmented with additional columns for confidence intervals and indicators specifying significant DIF.

Each data frame corresponding to a 'TERM' statement contains following columns:

itam nn	Itam number
item.nr	Item number
item	Name of item
ESTIMATE	Estimated difficulty of item
ERROR	Standard error of estimated item difficulty
outfit	Item's 'Outfit'
outfit.ci.lb	Lower bound of the outfit confidence interval
outfit.ci.ub	Upper bound of the outfit confidence interval
outfit.t	T-value for outfit
infit	Items's 'Infit'
infit.ci.lb	Lower bound of the infit confidence interval
infit.ci.ub	Upper bound of the infit confidence interval
infit.t	T-value for infit
abs.dif	Only for DIF analysis. Absolute DIF, computed as 2*[group-specific parameter].
ci.lb	Lower bound confidence interval for specific significance level of 90, 95 or 99 percent.
ci.ub	Upper bound confidence interval for specific significance level of 90, 95 or 99 percent.

When latent regression was specified, the last element of the returned list is a data frame with regression coefficients, corresponding to the number of dimensions and the number of regressors. Regressor names, regression coefficients and its standard errors are given for each dimension.

Indicates whether the corresponding item matches both DIF criteria. See details.

Rows represent the regressors, columns represent the latent dimension to which the regression is fitted.

Author(s)

sig

Sebastian Weirich

28 get.wle

get.wle	Read ConQuest WLE or MLE Output Files.	

Description

Read Conquest files comprising maximum likelihood estimates (MLE) or weighted likelihood estimates (WLE).

Usage

```
get.wle(file)
```

Arguments

file Character string with the name of the ConQuest MLE or WLE file.

Value

A data frame with one row per person containing the following columns.

case	Case number
ID	Identifier for this case
n.solved	Number of items this person answered correctly
n.total	Number of total items presented to this person
wle	WLE or MLE estimate. The last number of the columns name indicates the dimension the WLE or MLE estimate belongs to.
wle.se	Standard error of WLE or MLE estimate. The last number of the columns name indicates the dimension the WLE or MLE estimate belongs to.

Author(s)

Sebastian Weirich

References

See pp.230 of Wu, M.L., Adams, R.J., Wilson, M.R., & Haldane, S.A. (2007). *ACER ConQuest Version 2.0. Generalised Item Response Modeling Software*. Camberwell, Victoria: ACER Press.

getConquestVersion 29

getConquestVersion get version (build) of ConQuest

Description

get version (build) of ConQuest

Usage

```
getConquestVersion ( path.conquest , path.temp, asDate = TRUE )
```

Arguments

path.conquest full path to ConQuest executable console

path.temp optional: writeable folder used for temporary files. If not specified, R working

directory will be used. Without writing access, NULL is returned.

asDate if TRUE an object of class 'date' is returned if FALSE a character string is returned

Value

depends on option 'asDate'

Author(s)

Martin Hecht

Examples

```
getConquestVersion ( "c:/ConQuest/console_Feb2007.exe" )
```

isConverged

check convergence of ConQuest models

Description

checks if ConQuest models in a directory have converged or not

Usage

```
isConverged ( path , txt = FALSE )
```

Arguments

path main path of ConQuest models, or a path to a ConQuest shw-file

txt if TRUE a convergence summary is written to convergence_summary.txt in path,

and a file (either " $_CONVERGED_$ " or " $_N_O_T_CONVERGED_$ ") is written to each model directory if FALSE a data.frame of convergence information is

returned

30 log2init

Details

if path is a directory, isConverged checks recursively in path for shw files; alternatively path can be a full path to a single shw-file. models that converged, but the solution is not the best solution (ConQuest: "At termination the solution was not the best attained solution"), are treated as not converged

Value

depends on txt if no shw-files are found NULL is returned

Author(s)

Martin Hecht

log2init

Convert ConQuest Log to ConQuest Init

Description

Convert a ConQuest logfile to ConQuest covariance, regression and item init files

Usage

```
log2init ( log.path , out.path = NULL , iteration = c("highestLikelihood","last","first") , out.
```

Arguments

```
\begin{tabular}{ll} log.path & full path to or connection of ConQuest logfile \\ out.path & path of output files , if NULL folder of log.path is defaulted \\ iteration & either "highestLikelihood" (default), "last" or "first", or a number out.files.suffix \\ \end{tabular}
```

suffix to be added to output file names

Details

ConQuest tends to not completely write out log if running and option 'update = yes' is used. To avoid warnings and malfunction manually delete the last potentially incomplete iteration from log-file.

Value

```
writes files to out.path
```

Author(s)

Martin Hecht

```
## Not run:
log2init ( bzfile ( file.path( .Library , "eat/extdata/ConQuest.Log.Example1.log.bz2" ) ) , "c:/temp" )
## End(Not run)
```

long2matrix 31

long2matrix	long2matrix
TOTISZIIIG CI TX	iong 2 mairix

Description

transforms long format data.frame into a matrix format data.frame

Usage

```
long2matrix ( dat , sort = TRUE , triangle = NULL ,
force.diagonal = FALSE , exclude.diagonal = FALSE ,
long2matrix = TRUE )
```

Arguments

data.frame with columns "row", "col", "val"

sort sort rows and columns of matrix

triangle if not NULL a symmetric matrix will be constructed available options are "upper", "lower", "both"

force.diagonal a diagonal is forced into matrix even if no diagonal elements are in dat exclude.diagonal

the diagonal is excluded if possible

long2matrix if FALSE dat is not transformed

Details

WARNING: This function seems to be buggy. Do not use it or use it with care.

Value

Author(s)

Martin Hecht

```
d1 <- data.frame (
"row" = c ( "v1" , "v2" , "v2" , "v3" , "v1" , "v3" ) ,
"col" = c ( "v1" , "v3" , "v2" , "v1" , "v2" , "v3" ) ,
"val" = c ( 1 , 5 , 4 , 3 , 2 , 6 ) , stringsAsFactors = FALSE )
# unsorted matrix
long2matrix ( dat = d1 , sort = FALSE )
# sorted by default
long2matrix ( dat = d1 )
# extract upper triangle of symmetric matrix</pre>
```

32 long2symmatrix

```
long2matrix ( dat = d1 , triangle = "upper" )
# exclude diagonal elements
long2matrix ( dat = d1 , triangle = "upper" , exclude.diagonal = TRUE )
# if full matrix ("both" triangles) is requested, the diagonal cannot be excluded, option is ignored
long2matrix ( dat = d1 , triangle = "both" , exclude.diagonal = TRUE )

# no diagonal elements are specified
d2 <- data.frame (
"row" = c ( "v2" , "v1" , "v1" ) ,
"col" = c ( "v3" , "v3" , "v2" ) ,
"val" = c ( 5 , 3 , 2 ) , stringsAsFactors = FALSE )

long2matrix ( dat = d2 )
# diagonal is set (with NAs)
long2matrix ( dat = d2 , triangle = "upper" , force.diagonal = TRUE )</pre>
```

long2symmatrix

long2symmatrix

Description

transforms long format data.frame into a symmetric matrix format data.frame

Usage

```
long2symmatrix ( dat , sort = FALSE , triangle = c ("both","lower","upper") ,
include.diagonal = TRUE , full.symmetric = FALSE )
```

Arguments

data.frame with columns "row", "col", "val"

sort sort rows and columns of matrix, can be either logical (if TRUE variables are alphatecially sorted) or a character vector that indicates order

triangle if "lower" or "upper" only this triangle is extracted (the other is set to NA), if "both" both triangles are extracted

include.diagonal logical, should diagonal elements be included or not

full.symmetric if TRUE

Details

WARNING: This function has not been thoroughly tested. if sort = FALSE and triangle = "lower" matrix is sorted by occurence on dat\$row if sort = FALSE and triangle = "upper" matrix is sorted by occurence on dat\$col triangle = "both" implies sort = TRUE

Value

data.frame in "matrix format"

Author(s)

make.link.dummy 33

Examples

```
long <- data.frame (
"row" = c ( "v1" , "v2" , "v2" , "v3" , "v1" , "v3" ) ,
"co1" = c ( "v1" , "v3" , "v2" , "v1" , "v2" , "v3" ) ,
"val" = c ( 1 , 5 , 4 , 3 , 2 , 6 ) , stringsAsFactors = FALSE )

long2symmatrix ( long )

long2symmatrix ( long , triangle = "lower" )
long2symmatrix ( long , triangle = "upper" )
long2symmatrix ( long , triangle = "both" )

long2symmatrix ( long , triangle = "lower" , include.diagonal = FALSE)
long2symmatrix ( long , triangle = "upper" , include.diagonal = FALSE)
long2symmatrix ( long , triangle = "both" , include.diagonal = FALSE)

long2symmatrix ( long , sort = c("v2","v3") )
long2symmatrix ( long , sort = c("v2","v3") ) , triangle = "lower" , include.diagonal = FALSE )

long2symmatrix ( long , full.symmetric = TRUE )
long2symmatrix ( long , full.symmetric = TRUE , triangle = "lower" , include.diagonal = FALSE )</pre>
```

make.link.dummy

make.link.dummy

Description

create a structure as input for bi.linking

Usage

```
make.link.dummy ( dfr , analysis.name = "dummy.analysis" , scale.name = "dummy.scale", group.nam
```

Arguments

```
data.frame with items, item difficulty ("b") and standard error of b ("b.se"); colnames must be "item", "b", "b.se"

analysis.name name of analysis

scale.name name of scale (dimension)

group.name name of (person) group
```

Value

returns a structure as if created by automateModels with data contained in dfr; this object can be used as input for bi.linking

Author(s)

Examples

plotDevianceChange

plot deviance change

Description

extract or plot (on console or to pdf) deviance change from ConQuest logfile

Usage

```
\verb|plotDevianceChange| ( path , plot = TRUE , pdf = FALSE , out.path = NULL , extreme.crit = 0.75 )|
```

Arguments

path full path to or connection of ConQuest logfile, or just a path (in which ConQuest

logfiles are to be (recursively) searched for)

plot if TRUE deviance change plot is created

pdf if TRUE plot ist written to pdf

out.path path for pdf output file

extreme.crit numeric, threshold criterion to remove outliers, is multiplied with standard de-

viation of deviance change

Details

ConQuest tends to not completely write out log if running and option 'update = yes' is used. To avoid warnings and malfunction manually delete the last potentially incomplete iteration from log-file. Points below 0 are red; if model converged (see link{isConverged} for details), the last point is larger and green

Value

depends on plot and pdf; if both are FALSE the deviance change data is returned, this is a named vector with names = iteration number and values = deviance change from previous iteration; if more than one ConQuest logfile is processed a list of named vectors is returned

Author(s)

plotDistributions 35

Examples

```
## Not run:
plotDevianceChange ( path = file.path( .Library , "eat/extdata/ConQuest.Log.Example1.log.bz2" ) )
plotDevianceChange ( path = file.path( .Library , "eat/extdata/ConQuest.Log.Example1.log.bz2" ) , plot = File.path( Not run)
## End(Not run)
```

plotDistributions

plot latent distribution

Description

creates latent distribution plots of two distributions on the same metric (e.g. persons and items)

Usage

```
plotDistributions ( distr1 , distr2 , distr1.name = "Persons" , distr2.name = "Items" , pdf = NU
```

Arguments

```
distr1
                  numeric vector of person estimates
distr2
                  numeric vector of item estimates
                  name of distribution 1 (e.g. "Persons")
distr1.name
distr2.name
                  name of distribution 2 (e.g. "Items")
                  pdf output file
pdf
title
                  title for graph
                  name of units
scale.unit
                  color of distribution 1
distr1.color
                  color of distribution 2
distr2.color
alpha
                  controls transparency of graph, see geom_density
```

Author(s)

Martin Hecht

```
## Not run:
persons <- rnorm ( 5000 )
items <- rnorm ( 200 ) + 1

plotDistributions ( persons , items )
## End(Not run)</pre>
```

36 read.txt

read.txt read text files

Description

reads (compressed) text files with specific method

Usage

```
read.txt ( path , read.function = c ( "readLines" , "read.table" , "read.csv" , "read.csv2" , "r
```

Arguments

path	either directory, file, list of directories, list of files, vector of directories or vector of files
read.function	function to read in txt files, bzfile, read.table, read.csv, read.csv2, read.delim, or read.delim2
file.ext	character, extension of files that are to be read, extensions of compressed files are ignored, that means that file.ext refers to extension of uncompressed file and extension of compressed file without compression extension
simplify	logical, if TRUE list is unlisted if of length 1, if FALSE always a list is returned
	arguments passed to function used as read.function; if path is (list/vector of) directory/ies, arguments 'all.files', 'recursive', 'pattern' and 'ignore.case' can be passed to list.files that is used to get all compressed files from directory

Details

reads text files with specific read function (read.function); compressed files are automatically uncompressed depending on their extension, see zip2con for supported compression types; if path is a single file that does not exists, it is searched for a compressed file with this name, if found this is used

Value

returns list of read in files (also see simplify); names of list are file names (full path) without compression extension; if path is not processable NULL is returned, or (when multiple files are processed) it is not appended to return list

Author(s)

Martin Hecht

```
## Not run:
fl <- file.path( .Library , "eat/extdata/ConQuest.Log.Example1.log.bz2" )
lns <- read.txt ( fl )
lns <- read.txt ( bzfile ( fl ) )
lns <- read.txt ( list ( fl , fl ) )
lns <- read.txt ( c ( fl , fl ) )
str ( lns )</pre>
```

sortDatByNames 37

```
## End(Not run)
```

sortDatByNames

sort data.frame by colnames and/or rownames

Description

specify new colnames and/or rownames order, data.frame is sorted in accordance

Usage

```
sortDatByNames ( dat , col.order = NULL , row.order = NULL , warn = TRUE )
```

Arguments

dat	data.frame
col.order	character vector of colnames in new order
row.order	character vector of rownames in new order
warn	logical, if TRUE warnings are printed on output window if col.order/row.order do not correspond to colnames/rownames resp.

Value

data.frame

Author(s)

Martin Hecht

```
dat <- data.frame ( matrix ( rnorm ( 100 ) , ncol = 10 ) )
colnames ( dat ) <- paste ( "X" , 10:1 , sep = "" )
rownames ( dat ) <- paste ( "X" , 11:2 , sep = "" )
dat

# sort data.frame by col.order and row.order
sortDatByNames ( dat , paste ( "X" , 1:10 , sep = "" ) , paste ( "X" , 2:11 , sep = "" ) )</pre>
```

38 userSpecifiedList

source.it.all source.it.all

Description

sources *.R files of folder

Usage

```
source.it.all ( folder="p:/ZKD/development" , use.zkd.conv = TRUE , development = TRUE , development
```

Arguments

folder folder with *.R files

development if TRUE development versions are sourced (if non-existent the latest stable is

sourced or nothing is sourced, see option development.only\ if FALSE stable

versions are sourced

use.zkd.conv if TRUE R files in folder are checked to be consisten with specific ("zkd") ver-

sioning convention \ if FALSE all R files in folder are sourced

development.only

if TRUE only development versions are sourced \ if FALSE stable versions are

included

exclude character vector of R files that should not be sourced

Value

sources R files

Author(s)

Martin Hecht, Christiane Penk

Description

When a function requires several arguments as a list, userSpecifiedList is designed to 'match' users arguments to default argument structure.

Usage

```
userSpecifiedList(1, 1.default, el.default = NULL)
```

Arguments

1 A named or unnamed list or vector of elements.

el.default if length of l is longer than 1, el.default can be set to an numeric value to

select one default element

yen.q3

Value

A list of arguments where the user specified arguments are matched into default arguments. If el.default is set, one element is returned.

Author(s)

Sebastian Weirich

Examples

```
default.arguments <- list(logfile = TRUE, systemfile = TRUE, history = TRUE, covariance = TRUE, reg_coeffict
users.arguments <- c(FALSE, FALSE)
userSpecifiedList ( l = users.arguments, l.default = default.arguments)

users.arguments <- list(history = FALSE)
userSpecifiedList ( l = users.arguments, l.default = default.arguments)

users.arguments <- FALSE
names(users.arguments) <- "covariance"
userSpecifiedList ( l = users.arguments, l.default = default.arguments)</pre>
```

yen.q3 yen.q3

Description

Q3 statistics

Usage

```
yen.q3 ( dat , theta , b , progress = T )
```

Arguments

```
dat bla theta bla b bla progress bla
```

40 zip2con

zip2con

convert compressed file(s) to connection(s)

Description

convert compressed file(s) to a list of connection(s)

Usage

```
zip2con ( path , ... )
```

Arguments

either directory, file, list of directories, list of files, vector of directories or vector of files

arguments passed to file handling function by file; if path is (list/vector of) di

arguments passed to file handling function bzfile; if path is (list/vector of) directory/ies, arguments 'all.files', 'recursive', and 'ignore.case' can be passed to list.files that is used to get all compressed files from directory

Details

function converts file(s) to connections by calling the appropriate uncompress function depending on file extension; currently supported are files with extensions "bz2" that are processed by bzfile

Value

returns list of connection(s); names of list are file names (full path) without compression extension; if path is already a connection it is returned as named list if path is not processable NULL is returned, or (when multiple files are processed) it is not appended to return list

Author(s)

Martin Hecht

```
## Not run:
fl <- file.path( .Library , "eat/extdata/ConQuest.Log.Example1.log.bz2" )
zip2con ( fl )
zip2con ( bzfile ( fl ) )
zip2con ( list ( fl , fl ) )
zip2con ( c ( fl , fl ) )
## End(Not run)</pre>
```
